20-Hydroxyecdysone (20E-BIO101)

20E (BIO101) is a new oral drug candidate activating the MAS receptor (a major receptor in the renin-angiotensin system) leading to muscle anabolism, which already demonstrated meaningful activity in animal models of muscular dystrophies (Lafont *et al.*, 2022) and respiratory function. Furthermore, 20E (BIO101) has also demonstrated beneficial effects in two vulnerable populations in clinical settings, in the COVA and SARA-INT trials.

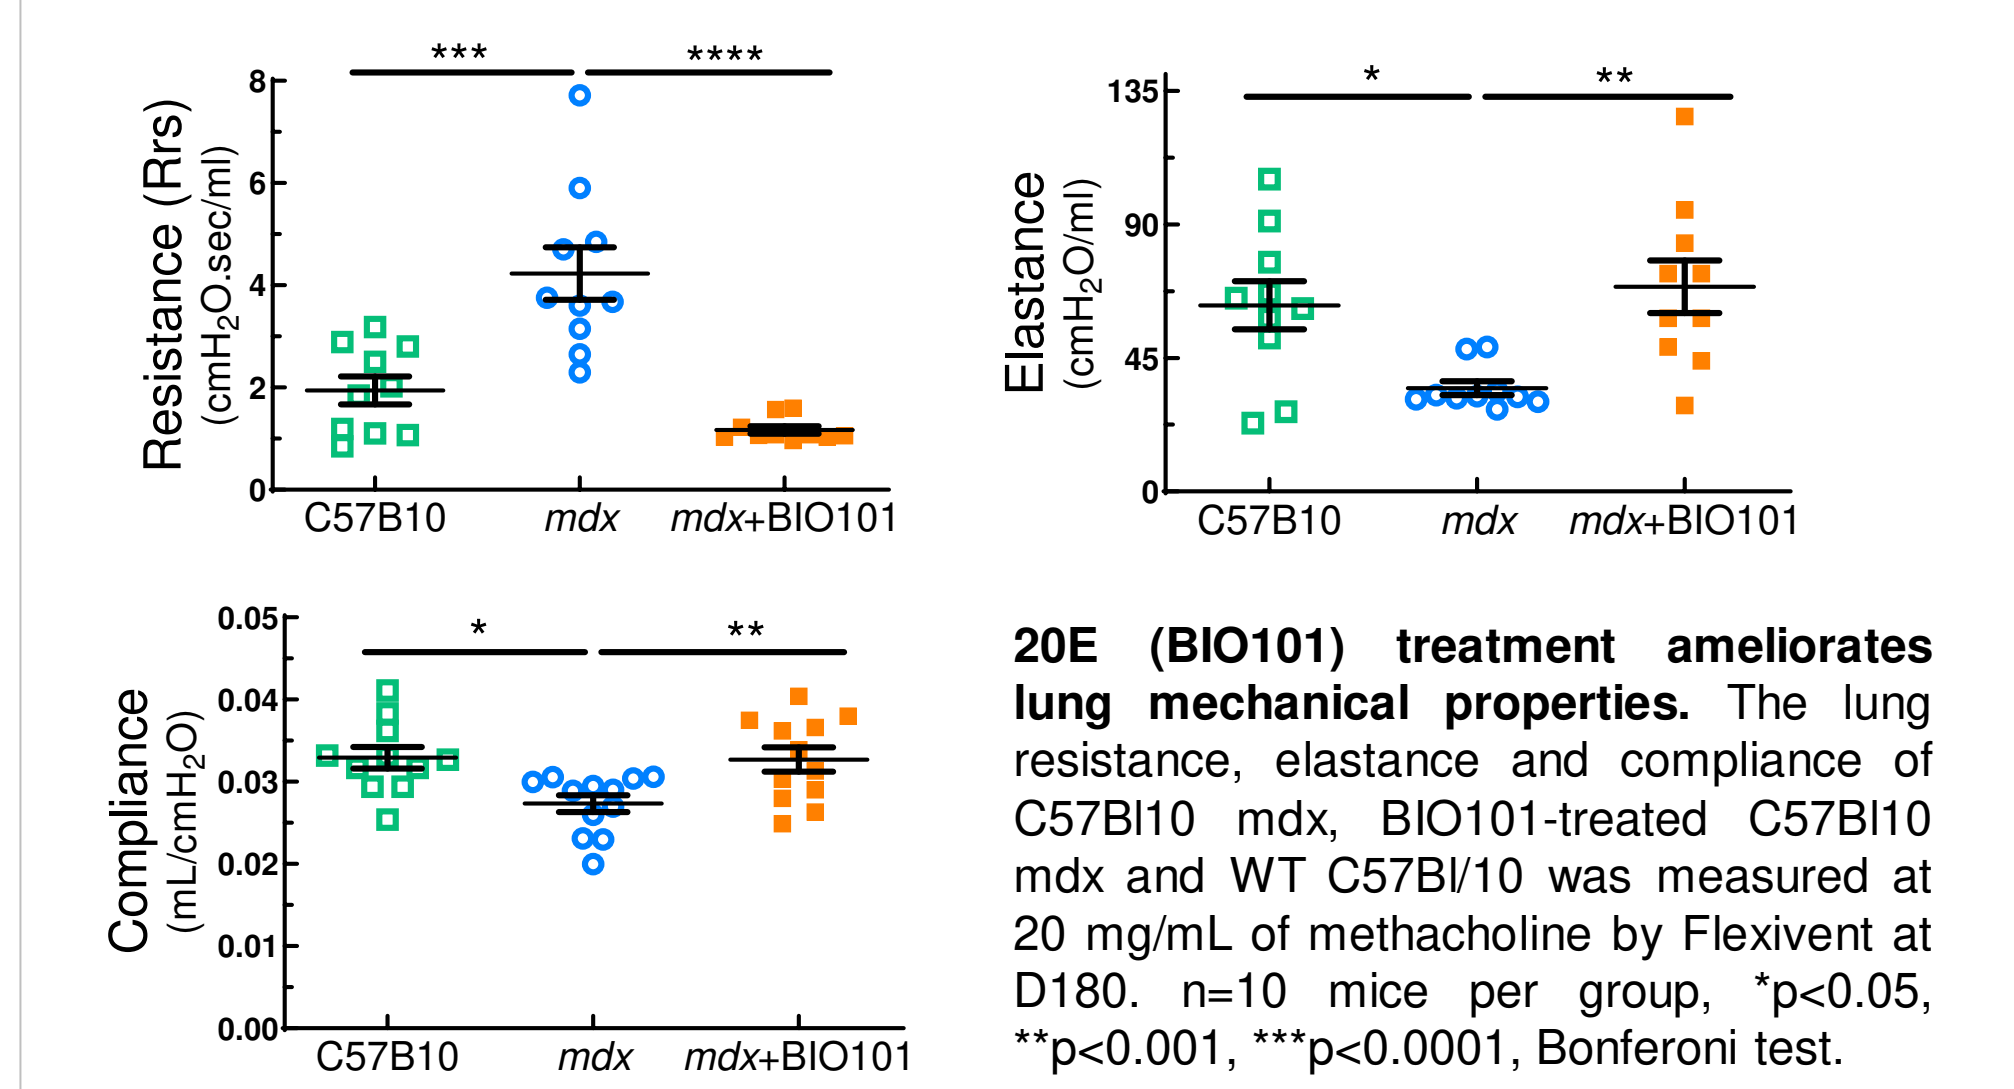

Duchenne Muscular Dystrophy Preclinical Data on respiratory function in mdx mice

- Whole body Plethysmography

- > BIO101 treatment significantly improves airway responsiveness as measured by PenH (normalization of PenH values vs control mice).
- > BIO101 effects are sustained for 6 months.

- FlexiVent

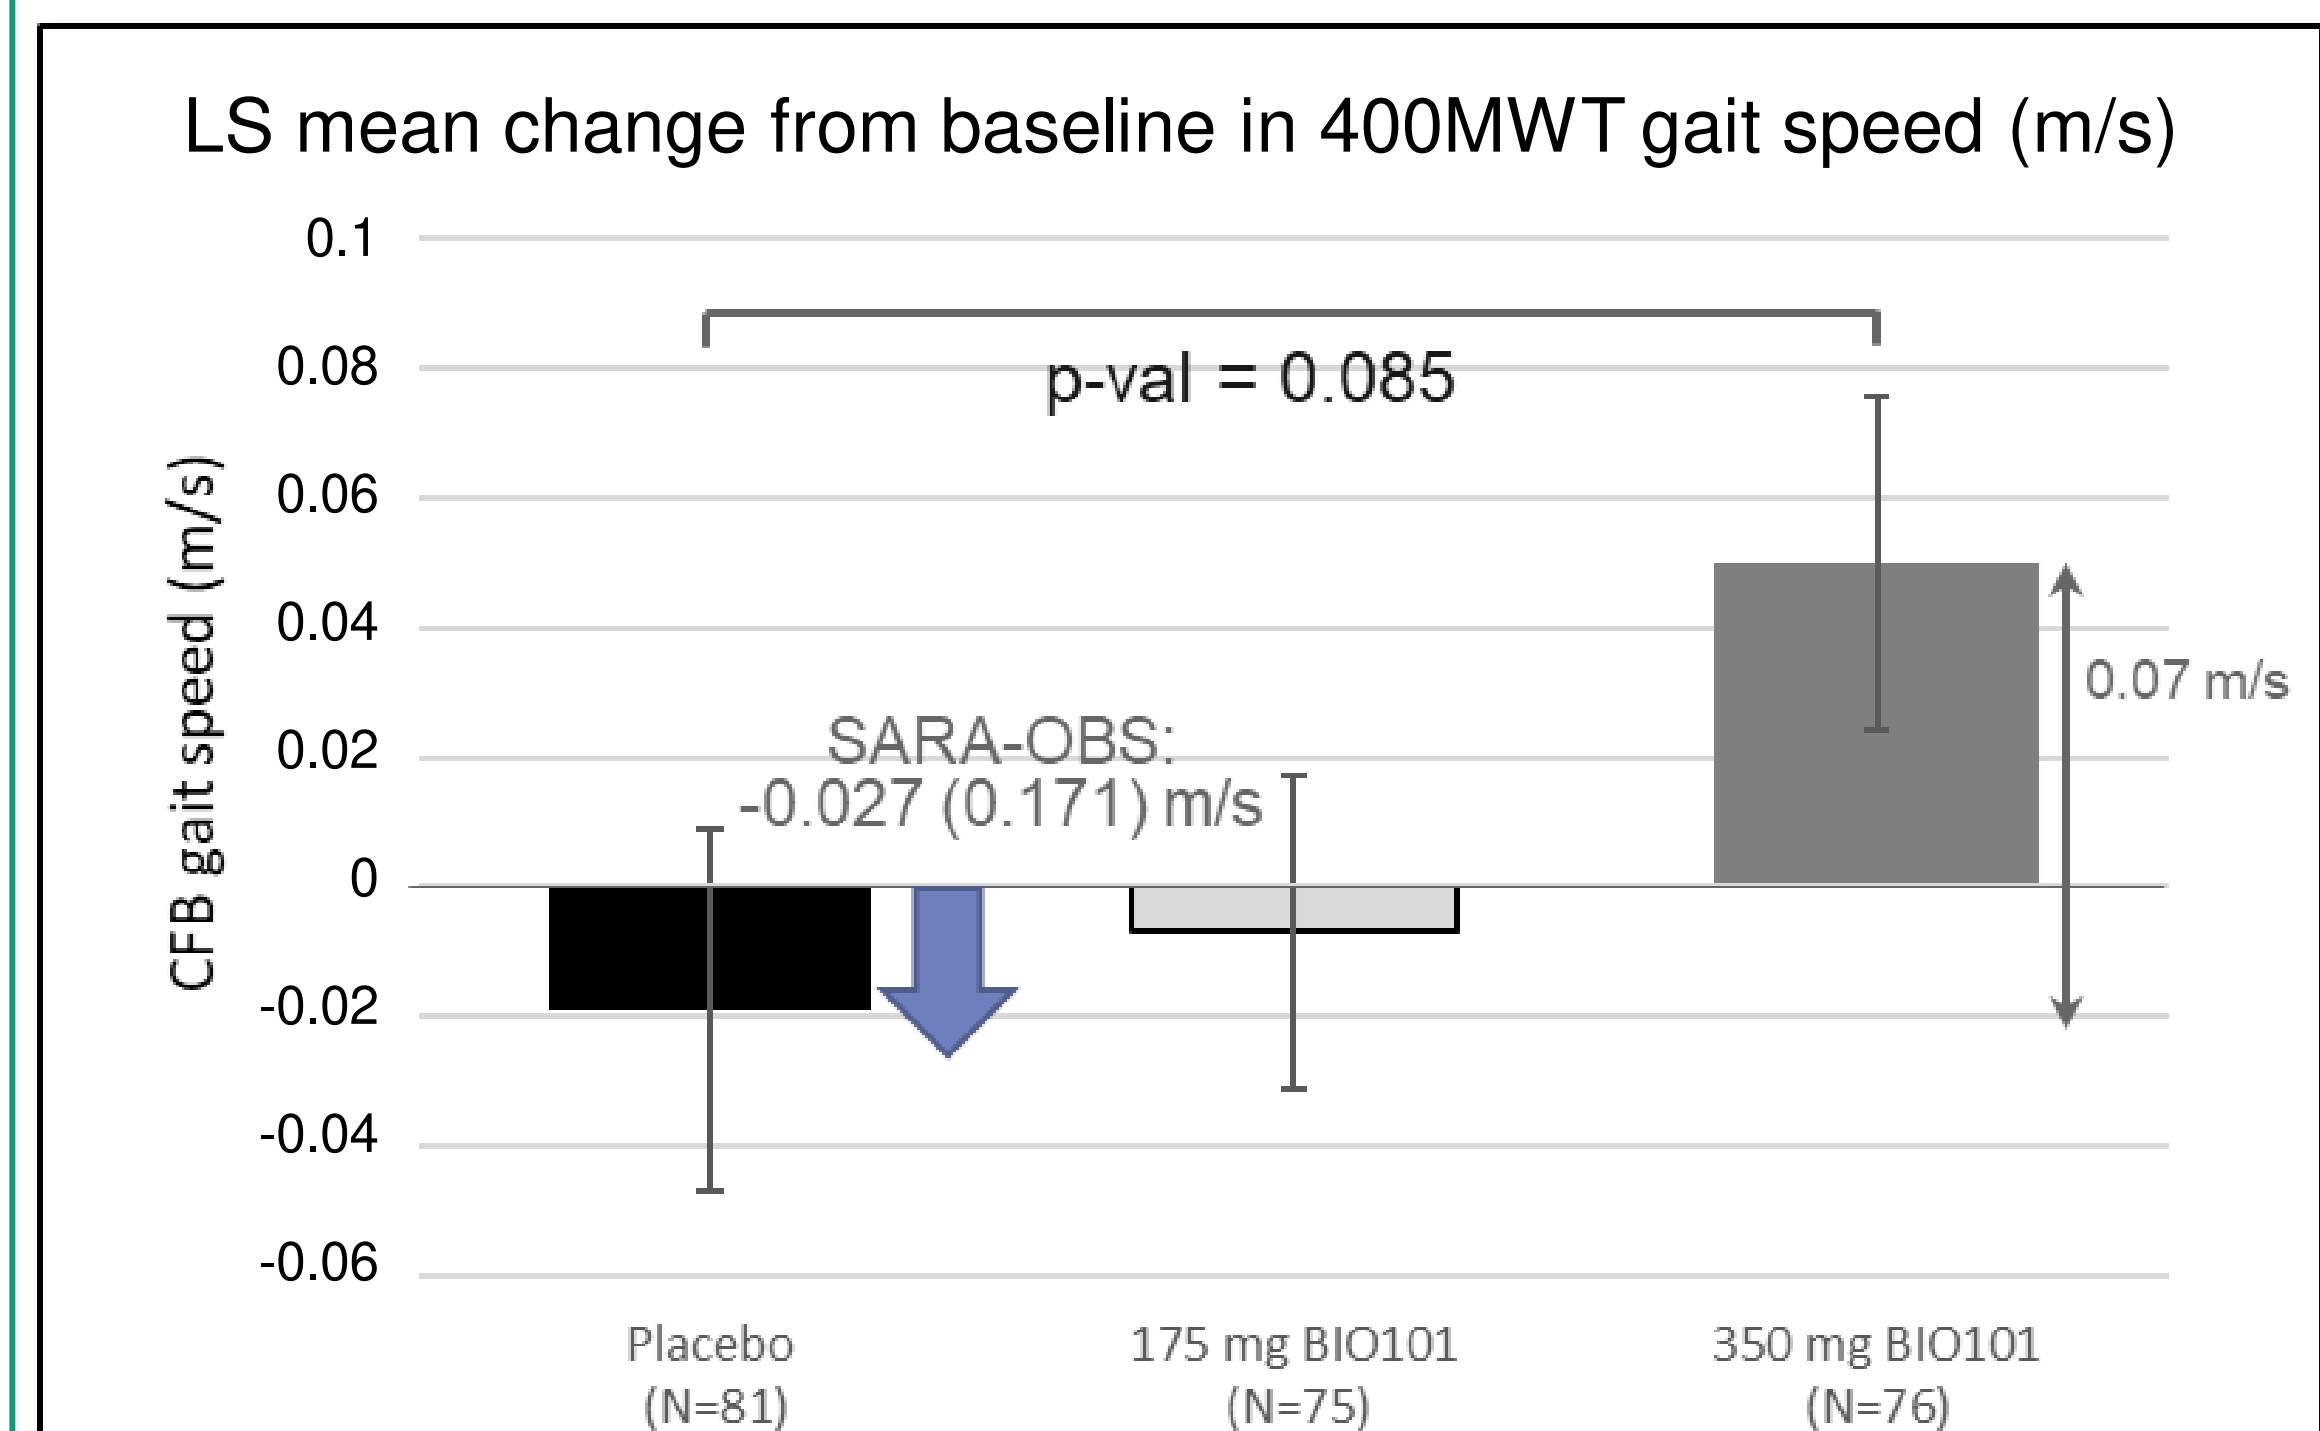

- > BIO101 treatment normalized C57BL/10 mdx mice lung mechanical properties such as resistance, elastance and compliance.

SARA-INT trial

233 Sarcopenic seniors aged 65+ (FNIH criteria + SPPB ≤8) administered with 20E at 2 doses (175 mg / 350 mg bid 20E versus placebo) up to 9 months

Secondary statistical analysis of Change From Baseline (CFB) in 400MWT gait speed based on Multiple Imputation for subjects without on-site visit data at M6 and adjusted Bayesian Imputation for non completers at M6 in the FAS population

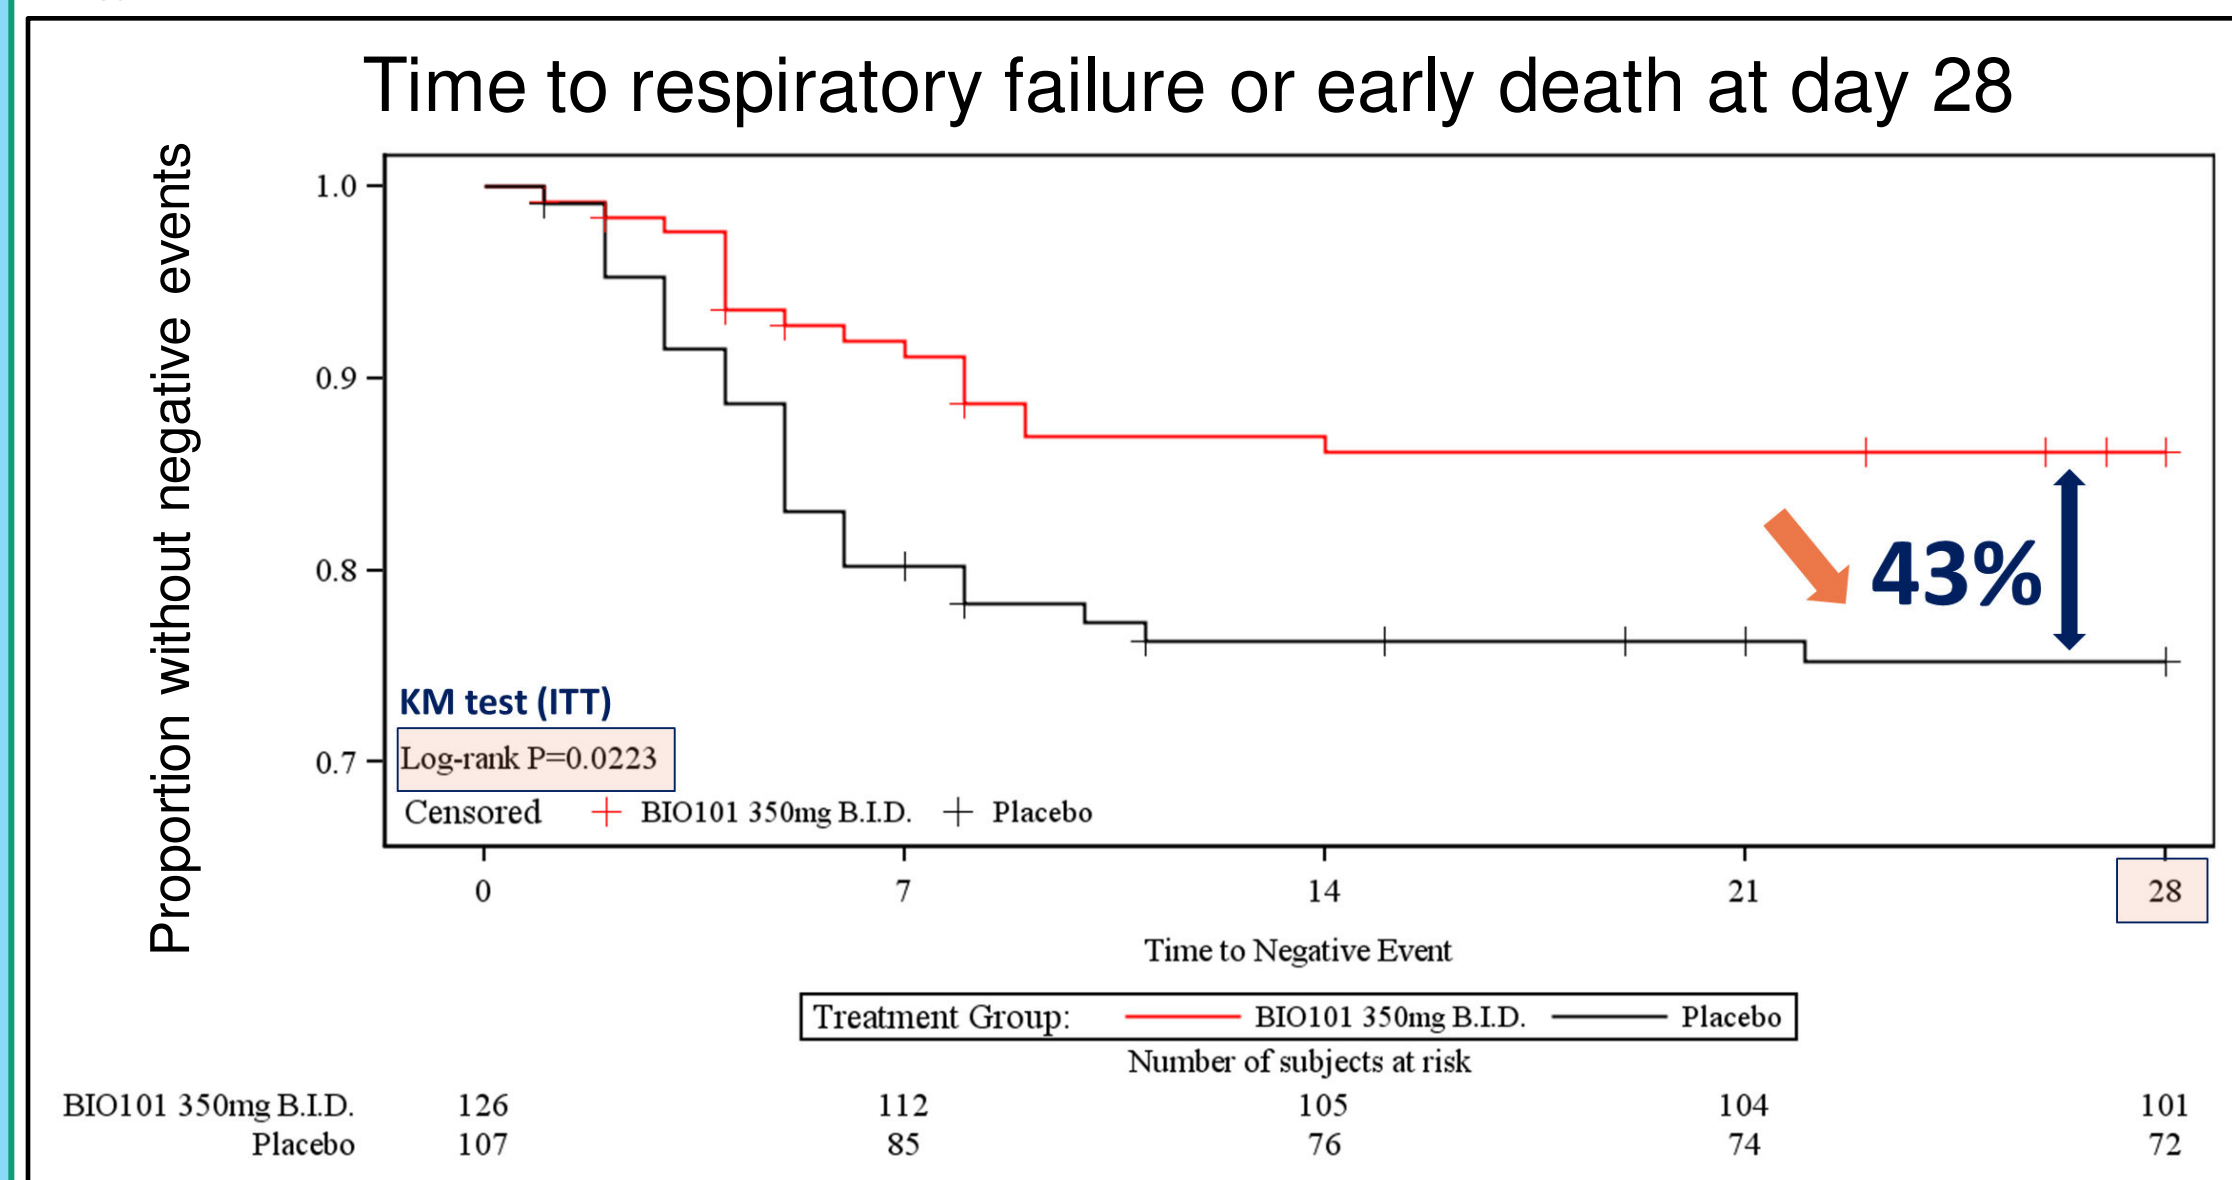

- > Natural deterioration in gait speed in placebo group, comparable to observational study
- > Trend for a dose effect
- > Close to statistical significance and close to clinical significance at the highest dose, consistent with other physical assessments

COVA trial

233 hospitalized patients with severe COVID-19 having signs of pneumonia who may or may not require oxygen supplementation, and who are not on invasive mechanical ventilation or ECMO (extracorporeal membrane oxygenation), administered with 20E 350 mg bid versus placebo up to 28 days.

KM analysis in the ITT population showed a difference in proportion of patients with respiratory failure or early death between 20E (BIO101) and placebo, p=0.0223 with a reduction of 43% in the treatment arm.

- > At Day 28, lower proportion of patients with respiratory failure or early death in 20E (BIO101) group versus placebo, CMH test, p=0.0426, with a relative risk reduction of respiratory failure or early death of 43.8%
- > Reduction in the relative risk of respiratory failure or early death by 43.8% at day 90
- > Trend in the adjusted difference in the proportion of patients with hospital discharge of 11% in 20E (BIO101) group versus placebo in ITT population, p= 0.0586 - CMH test.

20E safety profile

20E was administered to 253 vulnerable adults and showed a very good safety profile:

- > In the SARA-INT trial, 20E (BIO101) showed a good safety profile after up to 9 months of dosing, with no significant difference between treatment arms and placebo for TEAEs, related TEAEs and SAEs as well as biliary imaging studies, ECG, safety laboratory parameters and vital signs.
- > The COVA study showed a lower proportion of patients with TEAEs in the 20E (BIO101) 350 mg bid group than in the placebo group (57% vs 64.4%) and in particular, a lower frequency for serious respiratory TEAEs (25% vs 30.8%).

MYODA trial design

Trial design

- A Randomized, Double-Blind, multi-center Phase 1-2 Study
- 12 clinical centers US/EU
- Evaluation of the Safety, PK, PD and Efficacy of 20E in Non-Ambulatory DMD Patients with Respiratory Deterioration
- Pediatric oral formulation (powder suspension) of 20E

Study Endpoints

- Part 1 (N=15): Safety, tolerability & PK- initial 7 days of dosing of escalating dose of 20E (1.25 to 5 mg/kg)
- Part 2 (N=30 + 15 from Part1): Efficacy of 20E- Respiratory function after dosing for 48 weeks
- Endpoints: respiratory function (FVC, PEF), muscle strength (PUL, Myogrip), QoL questionnaires

Patient Population

- Age: ≥12 years old
- Non-ambulatory DMD patients, regardless of the genetic mutation
- Patients with respiratory failure not yet requiring mechanical ventilation

- > 20E (BIO101) is a promising oral treatment for DMD patients with respiratory deterioration.
- > Favorable safety profile (SARA-PK phase 1, good safety data on 149 SARA-INT participants with at least 6 Months of dosing)
- > Beneficial effects on motor function in sarcopenic patients (SARA-INT phase 2b) and beneficial effects on COVID-19 patients with respiratory failure (COVA phase 2/3)
- > ODD granted in Europe and US, Biophytis plans to start the Phase 1/2 MYODA clinical trial in the upcoming months.
